

微處理機系統與介面技術

LAB 7 – SPI

SPI - Serial Peripheral Interface

- Synchronous serial data communication(can operate in full duplex)
- 4 wire communication(SS,CLK,MOSI,MISO)
- MO has four set SPI

SPI register

- SPI->SSR: SPI slave select register

- SS_LVL
- AUTOSS
- SSR

- SPI->CNTRL: SPI control and status register

- SLAVE
- CLKP
- TX_NUM, TX_BIT_LEN
- TX_NEG, RX_NEG
- GO_BUSY

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved		LTRIG_FLAG	SS_LTRIG	AUTOSS	SS_LVL	SSR	

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
VARCLK_EN	TWOB	Reserved	REORDER		SLAVE	IE	IF
15	14	13	12	11	10	9	8
SP_CYCLE				CLKP	LSB	TX_NUM	
7	6	5	4	3	2	1	0
TX_BIT_LEN					TX_NEG	RX_NEG	GO_BUSY

ADXL SPI configuration

- SPI->DIVIDER: Set SPI clock(DIVIDER)
- SPI->SSR
 - SS line is active at low-level edge(SSR.SS_LVL)
 - Disable auto ss(SSR.AUTOSS)
- SPI->CNTRL
 - Set SPI as master mode(CNTRL.SLAVE)
 - CLK is idle at high(CNTRL.CLKP)
 - CPOL=1, CPHA=1(CNTRL.TX_NEG, RX_NEG)
 - 8 bit data length for each word transmit(CNTRL.TX_BIT_LEN)
 - One word in one transfer(CNTRL.TX_NUM)

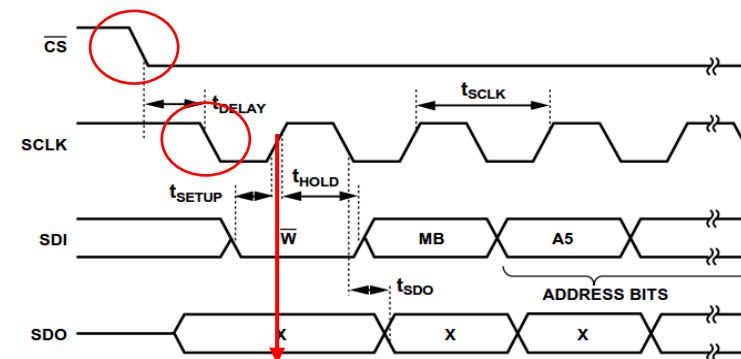

Figure 37. SPI 4-1

Figure 2: Clock Polarities and Clock Phases of SPI Modes

SPI Write operation

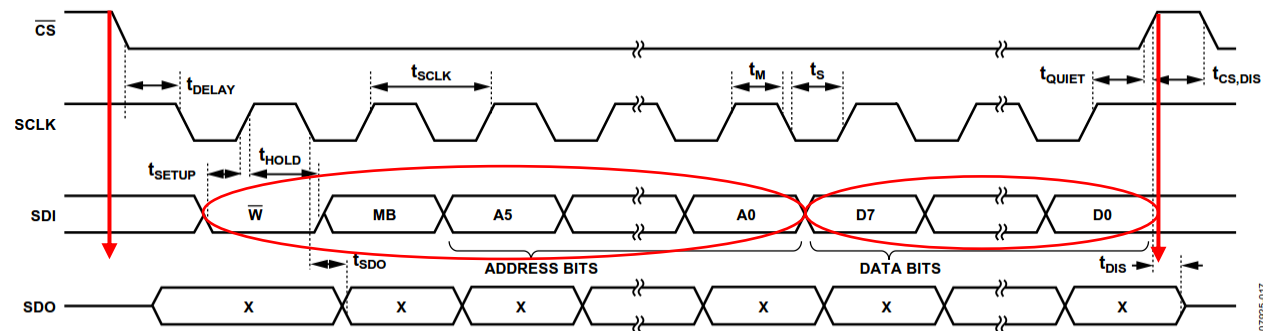

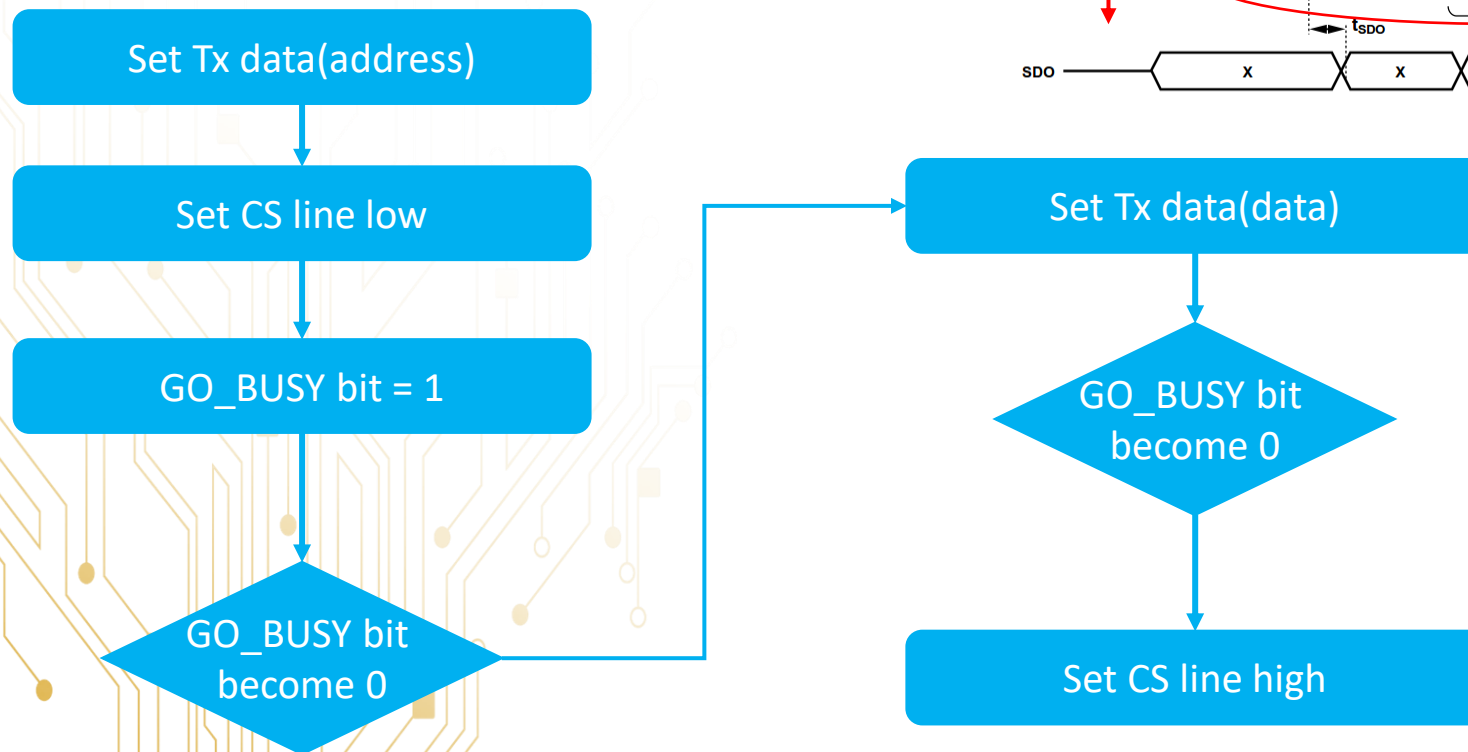

Figure 37. SPI 4-Wire Write

Tips: You can see NuMicro_SPI.ppt p.17 for the example code

SPI Read operation

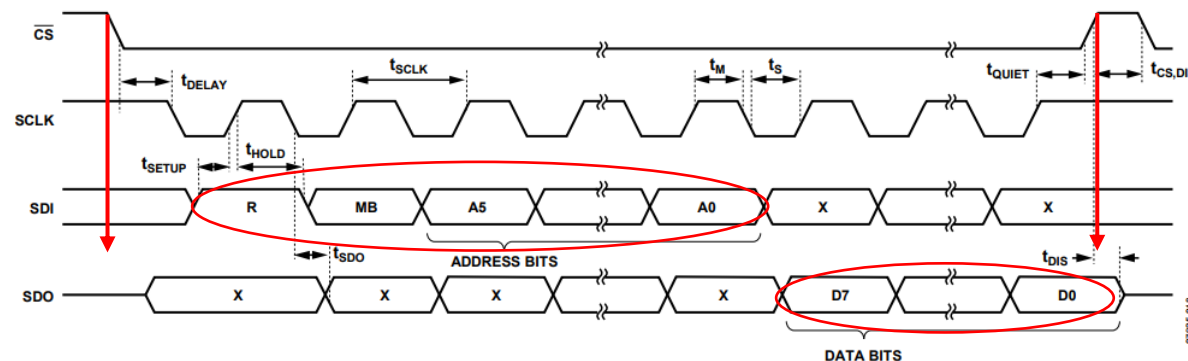

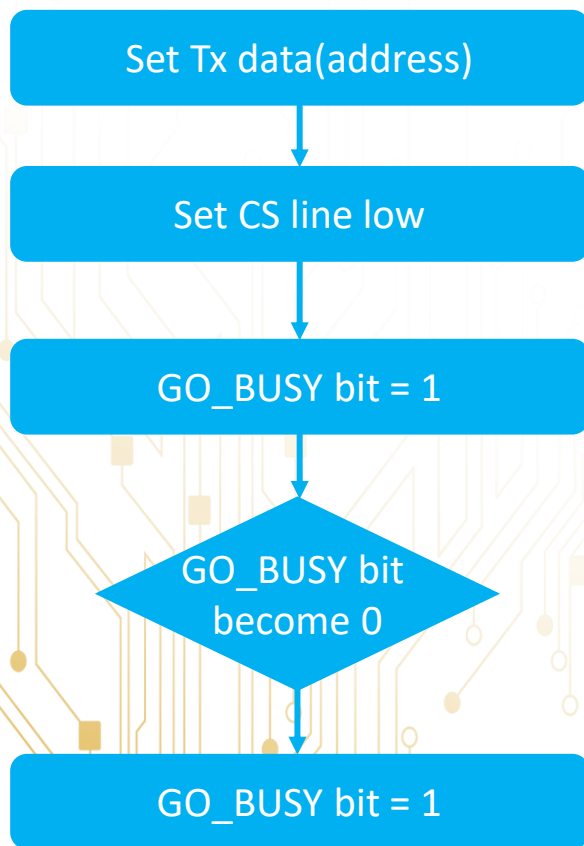

Figure 38. SPI 4-Wire Read

Tips: You can see NuMicro_SPI.ppt p.17 for the example code

ADXL SPI Read/Write

- Data format

- Read/Write bit + Multiple-byte bit + 6 bits address
- Configure 0x2D(0x0010_1101) as address, single-byte Read
 - Read + ~~MB~~ + address \rightarrow 0x1010_1101

R/W	MB	A5	A4	A3	A2	A1	A0
-----	----	----	----	----	----	----	----

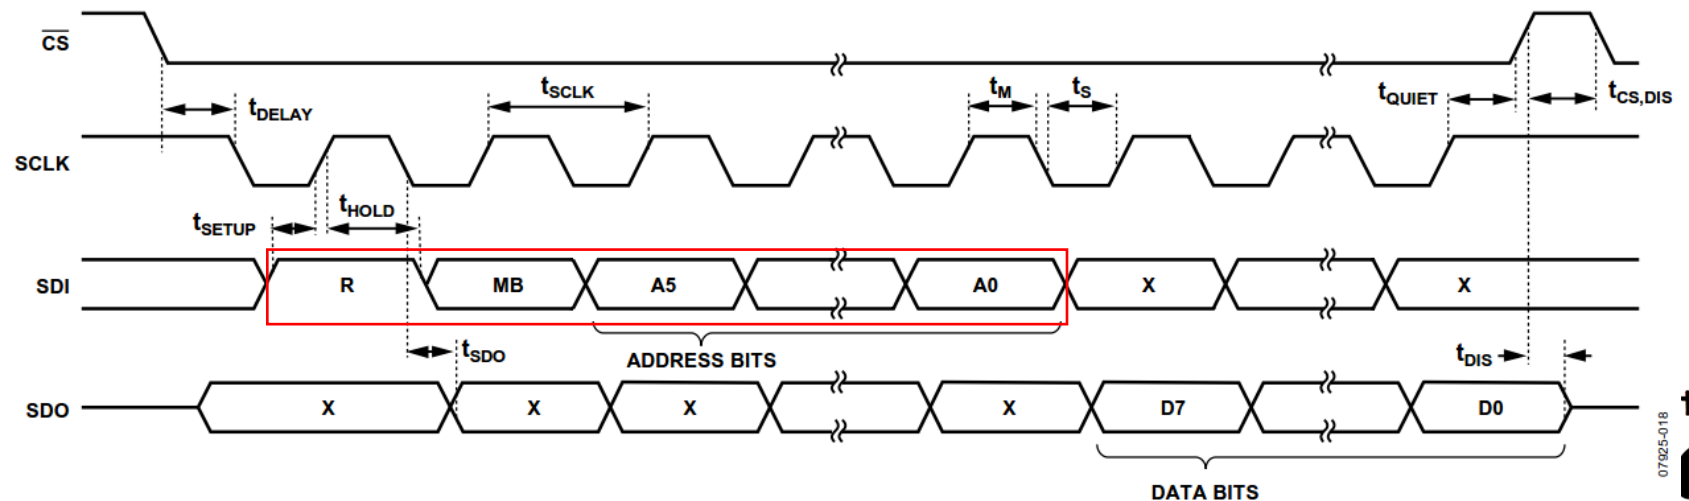

Figure 38. SPI 4-Wire Read

ADXL pin configuration

- CS -----> SPI2 CS(GPD0)
- SCL -----> SPI2 CLK(GPD1)
- SDO -----> SPI2 MISO(GPD2)
- SDA(SDI) ----> SPI2 MOSI(GPD3)

- Mark: Don't use SPI0

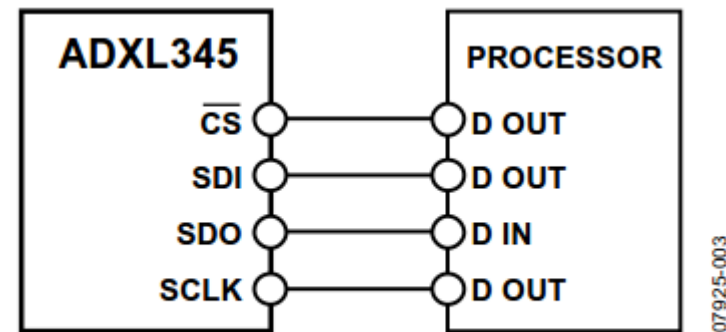

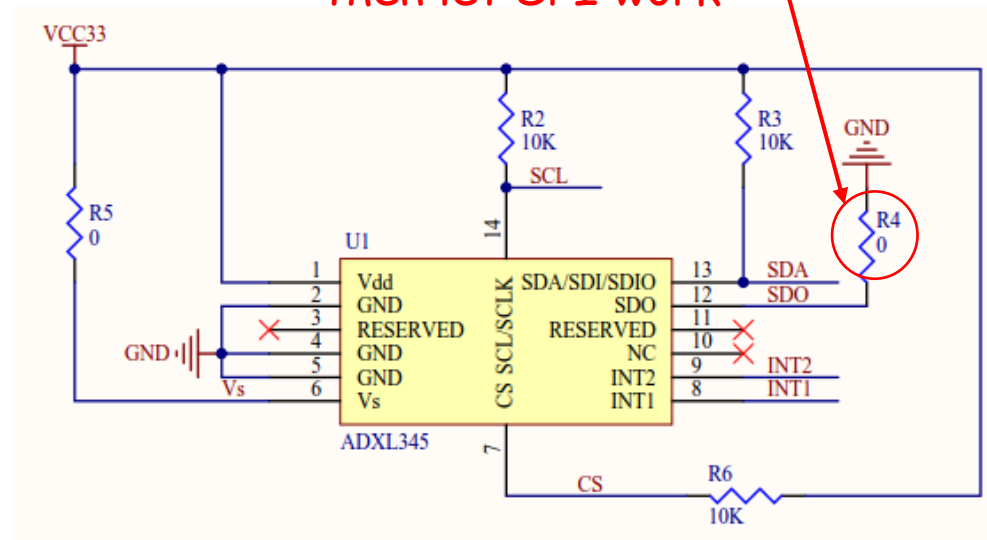

Figure 35. 4-Wire SPI Connection Diagram

Bad design for using SPI, we need to remove this resistor then let SPI work

Basic

- Read 3 axis accelerometer and print on putty
- Need to do calibration
 - Result = (Raw data \pm offset)/(256 \pm offset)

```
COM8 - PuTTY
ADXL init...
Start
x: -0.08, y: -0.04, z: -0.12
x: -0.02, y: -0.01, z: 1.01
x: -0.02, y: -0.01, z: 1.01
x: -0.03, y: -0.01, z: 1.01
x: -0.02, y: -0.01, z: 0.93
x: -0.02, y: -0.02, z: 1.02
x: -0.02, y: -0.02, z: 1.01
x: -0.02, y: -0.02, z: 1.00
x: -0.02, y: -0.02, z: 1.01
x: -0.02, y: -0.02, z: 1.02
x: -0.02, y: -0.01, z: 1.01
x: -0.02, y: -0.02, z: 1.02
x: -0.02, y: -0.02, z: 1.01
x: -0.02, y: -0.01, z: 1.02
x: -0.02, y: -0.01, z: 1.01
```

Figure 58. Output Response vs. Orientation to Gravity

Tips

- 範例程式: SPI_Loopback
- Easy test: you can read the adxl register 0x00 to test SPI communication is correct or not, it will return 0xE5 if your SPI is right
- Remember to change configuration in the SYS_init
 - Ex. CLK_SEL1(ModuleClock), GPx_MFP, ALT_MFP → change SPI to SPI2
- Do not use AutoSS, SPI.c SPI.h are useful.
- Be careful for the SPI configuration !!!
- You can write the code as the example.c

Demo

- Place: 創新大樓515 找助教 林子華(進門最後一排最裡面)
- Demo Time: (二)(三)下午三點~五點
- Report deadline: 1/1(五)
- Report title format: LABx_ID_Name
- Demo必須在Report deadline前完成
- Demo前須先上傳程式碼(上傳main所在的.c檔即可)

Graded

- Basic : 80%
- Report & Code : 20%
- Last LAB, and No Bonus. \ (^o^) /
